INTRODUCTION

(Fun Time) is a website that allows users to explore and register for global adventure events such as skydiving, bungee jumping, and paragliding.

The Fun Time Website is designed to facilitate the process of finding and booking activities for individuals and groups. It aims to provide a seamless user experience from registration through to payment, while also allowing for the addition of various services.

product scope

The system will include features for:
- User registration and profile management.
- Browsing activities by category (e.g., adult, kids, fun players).
- Booking activities and managing bookings.
- Payment processing.
- Notifications about bookings and updates.

Intended Audience

The Funtime website is intended for the following stakeholders:
- Project sponsors and stakeholders interested in the system's development.
- Software developers and engineers responsible for building the system.
- Testers who will validate the functionality and performance of the system.
- Users who will interact with the system to book activities.

GOALS:

The primary goals of the Fun Time Website are:

- To provide an intuitive platform for users: Adult, kids, fun players to discover and book activities easily.
- To ensure a secure and efficient payment process.
- To allow users to manage their bookings seamlessly.
- To enhance user engagement through timely notifications and updates.

Functional Requirements:

1. The system implements a robust registration and login feature that validates user credentials, provides error feedback, and achieves a 98% success rate in secure account access.

2. The system develops an account management system with encrypted password storage, secure login, password reset functionality, and account deactivation, maintaining zero vulnerabilities to security threats.

3. The admin creates a responsive search and filter feature allowing users to filter activities by age group and personal preferences, with search results loading within 2 seconds.

4. The system processes bookings and handles payment transactions securely, achieving a 99% completion rate without errors.

5. The system enables users to set and update preferences and profile information, with changes reflected immediately.

6. The system implements a reliable notification system that sends reminders for upcoming booked activities, with 95% of messages delivered at least 24 hours in advance.

7. The admin uploads and manages activity descriptions and images. The system provides comprehensive activity details with descriptions and images that load in under 2 seconds, ensuring users have access to essential information.

8. The system collects and displays user ratings and reviews instantly, maintaining a 1-second load time. The admin moderates and manages reviews to ensure compliance with platform guidelines.

Non-Functional Requirements:

1. Performance: Handle multiple requests with a short response time.

2. Security: SSL encryption, secure data storage, and protection against web security issues.

3. Availability: Accessible with minimal downtime and support for multiple languages and currencies.

4. Accessibility: User-friendly design that supports various devices and screen sizes.

5. Maintainability: Organized and documented code for easy updates.

Problems & Risks

1

Management Complexity: Difficulties in scheduling and bookings.
User Experience: Need for an intuitive interface.
Payment Issues: Secure integration of payment gateways.

2

Scalability: Handling peak loads effectively.
Security: Protecting sensitive user data.
Data Integrity: Ensuring accurate availability

3

Technical Risk: Integration delays and compatibility issues.
Financial Risk: Costs of payment systems and chargebacks.

4

Security Risk: Exposure to cyberattacks and insufficient encryption leading to data leaks.
Operational Risk: Downtime from server issues could lead to lost customers and revenue.
Legal Risk: Non-compliance with data regulations (e.g., GDPR) could result in fines.

User Classes and Characteristics

1. Kids
2. Adults
3. Fun Players
4. Activity Providers

System Administrators and Testers

System Administrators

Description: Staff managing overall system operations and user disputes.

Needs: Full control over site management, access to logs for monitoring, and robust security protocols.

Testers

Description: Users testing the website's functionality and performance pre-launch.

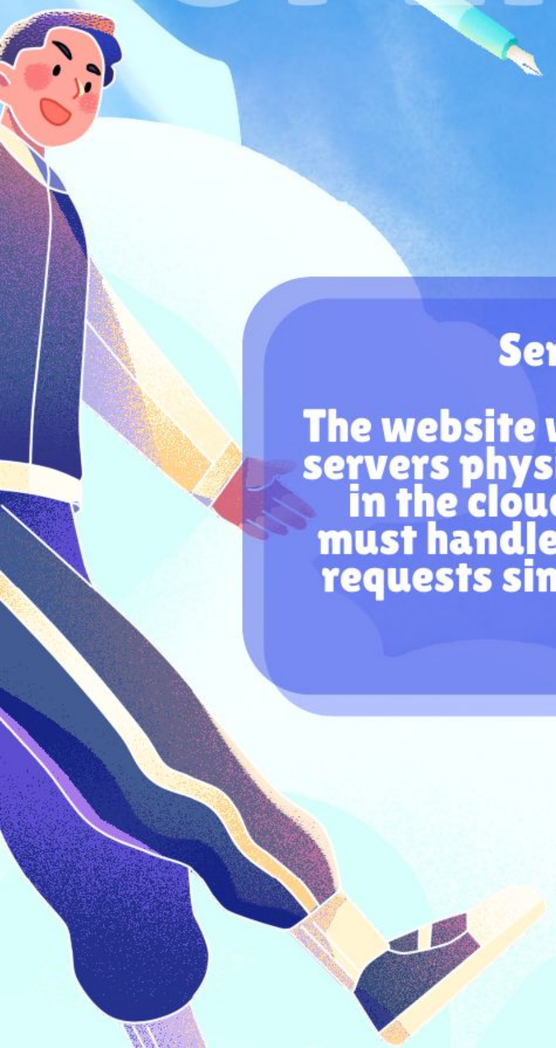

Needs: Access to front-end and back-end features, detailed logging for bug identification, and scenario simulation for diverse user groups.

User Needs

To provide a satisfactory experience, the system must address the following user needs:

1. Event Strategy: Enable users to search for activities suitable for their class (Kids, Adults, Fun Players).
2. Booking Strategy: Simplify the booking process for all user classes.
3. Payment Strategy: Ensure secure and diverse payment options.
4. Notification Strategy: Keep users informed about bookings and system updates.

OPERATING ENVIROMENT

Servers

The website will run on web servers physical, virtual, or in the cloud. The server must handle multiple user requests simultaneously.

Web Servers that the user will have access to, and interact with.

Storage

Database servers to store data related to events, bookings, users, payments, etc.

Constraints:

User Authentication and Management:
– Use secure password storage and enforce strong password policies.
– Restrict login attempts to prevent unauthorized access.

Search and Filtering
– Results must load within 2 seconds for a smooth experience.
– Support multiple filters and handle complex queries efficiently.

Booking and Purchasing
– The system must update ticket availability instantly.
– Parents should easily find suitable activities for their child's age.
– The process should be straightforward and efficient.

Event details
– Event details must update in real time.
– The interface must be user–friendly and accessible on all devices.

Admin Management
– Admins need the correct role to access sensitive data securely.
– The system must ensure data integrity and prevent unauthorized access.
– Admin changes must apply in real time.

Assumptions

To provide a satisfactory experience, the system must address the following user needs:

1. High smartphone penetration: The target audience is expected to primarily use mobile devices to access the website.
2. Consistent internet access: Users are assumed to have regular access to the internet, particularly in urban areas.
3. Familiarity with booking and online payments: Users are expected to have some experience with online booking systems and digital payment methods.
4. Peak usage during tourist seasons: The website is anticipated to experience in increased traffic during holidays and peak travel times.

THANK
YOU
